

St Michael's Easthampstead C of E (Voluntary Aided) Primary School Calculation Policy for the New Primary Curriculum

Aims of this Calculation Policy:

- 1) To support greater consistency in the teaching of mathematical calculations across the school
- 2) To strengthen continuity and progression in children's understanding of the development of calculations
- 3) To form a 'spine' or 'core' set of methods which every child will experience and can be built upon.
(Once children acquire mastery of these, other calculation methods can be introduced).
- 4) To build on models and images introduced to promote conceptual understanding.
- 5) To provide reference and guidance on the teaching of calculation skills for all teaching staff

Methods to support accurate calculation:

- R** Read the question carefully (preferably twice)
- U** Understand (and underline) the question. Make sure you know what to do.
- C** Choose the right calculation for the question.
- S** Solve the calculation (using the most efficient strategy that you know)
- A** Answer the question - is it what the question asked for?
- C** Check your solution - does it make sense?

Addition

Year 1 Add with numbers up to 20

Use numbered number lines to add, by counting on in ones. Encourage children to start with the **larger** number and count on.

Children should:

Have access to a wide range of counting equipment, everyday objects, number tracks and number lines, and be shown numbers in different contexts.

Read and write the addition (+) and equals (=) signs within number sentences.

Interpret addition number sentences and solve missing box problems, using concrete objects and number line addition to solve them: $8 + 3 = \square$
 $15 + 4 = \square$ $5 + 3 + 1 = \square$ $\square + \square = 6$

This builds on from prior learning of adding by combining two sets of objects into one group (5 cubes and 3 cubes) in Early Years.

Read strings or bead bars can be used to illustrate addition including bridging through ten by counting on 2 then counting on 3.

8 + 5

Key vocabulary: add, more, plus, and, make, altogether, total, equal to, equals, double, most, count on, number line

Key skills for addition at Y1:

- Read and write numbers to 100 in numerals, incl. 1–20 in words
- Recall bonds to 10 and 20, and addition facts within 20
- Count to and across 100
- Count in multiples of 1, 2, 5 and 10
- Solve simple 1-step problems involving addition, using objects, number lines and pictorial representations.

Video clips: [Using a range of equipment and strategies to reinforce addition statements](#)
[Partitioning to help add and subtract](#)

Addition

Year 2 Add with 2-digit numbers

Developing mental fluency with addition and place value involving 2-digit numbers, then establish more formal methods.

Add 2-digit numbers and tens:

Add 2-digit numbers and units:

Use empty number lines, concrete equipment, hundred squares etc. to build confidence and fluency in mental addition skills.

Add pairs of 2-digit numbers, moving to the partitioned column method when secure adding tens and units:

STEP 1: Only provide examples that do NOT cross the tens boundary until they are secure with the method itself.

STEP 2: Once children can add a multiple of ten to a 2-digit number mentally (e.g. 80+11), they are ready for adding pairs of 2-digit numbers that DO cross the tens boundary (e.g. 58 + 43).

STEP 3: Children who are confident and accurate with this stage should move onto the expanded addition methods with 2 and 3-digit numbers (see Y3).

To support understanding, pupils may physically make and carry out the calculation with Dienes Base 10 apparatus or place value counters, then compare their practical version to the written form, to help them to build an understanding of it.

Key vocabulary: add, more, plus, and, make, altogether, total, equal to, equals, double, most, count on, number line, sum, tens, units, partition, addition, column, tens boundary

Key skills for addition at Y2:

- Add a 2-digit number and ones (e.g. 27 + 6)
- Add a 2-digit number and tens (e.g. 23 + 40)
- Add pairs of 2-digit numbers (e.g. 35 + 47)
- Add three single-digit numbers (e.g. 5 + 9 + 7)
- Show that adding can be done in any order (the commutative law).
- Recall bonds to 20 and bonds of tens to 100 (30 + 70 etc.)
- Count in steps of 2, 3 and 5 and count in tens from any number.
- Understand the place value of 2-digit numbers (tens and ones)
- Compare and order numbers to 100 using < > and = signs.
- Read and write numbers to at least 100 in numerals and words.
- Solve problems with addition, using concrete objects, pictorial representations, involving numbers, quantities and measures, and applying mental and written methods.

Addition

Year 3 Add numbers with up to 3-digits

Introduce the **expanded column addition** method:

$$\begin{array}{r} 236 \\ + 73 \\ \hline 100 \\ 200 \\ \hline 309 \end{array}$$

Add the **units** first, in preparation for the compact method.

In order to carry out this method of addition:

Children need to recognise the value of the hundreds, tens and units without recording the partitioning.

Pupils need to be able to add in columns.

Move to the compact **column addition** method, with „carrying“:

236

Add units first.

+ 73

309

1

Children who are very secure and confident with 3-digit expanded column addition should be moved onto the compact column addition method, being introduced to „carrying“ for the first time. Compare the expanded method to the compact column method to develop an understanding of the process and the reduced number of steps involved.

Remind pupils the actual value is „three tens add seven tens“, not „three add seven“, which equals ten tens.

Key vocabulary: add, more, plus, and, make, altogether, total, equal to, equals, double, most, count on, number line, sum, tens, units, partition, plus, addition, column, tens boundary, hundreds boundary, increase, vertical, „carry“, expanded, compact

Key skills for addition at Y3:

- Read and write numbers to 1000 in numerals and words.
- Add 2-digit numbers mentally, incl. those exceeding 100.
- Add a three-digit number and ones mentally ($175 + 8$)
- Add a three-digit number and tens mentally ($249 + 50$)
- Add a three-digit number and hundreds mentally ($381 + 400$)
- Estimate answers to calculations, using inverse to check answers.
- Solve problems, including missing number problems, using number facts, place value, and more complex addition.
- Recognise place value of each digit in 3-digit numbers (hundreds, tens, ones.)
- Continue to practise a wide range of mental addition strategies, ie. number bonds, adding the nearest multiple of 10, 100, 100 and adjusting, using near doubles, partitioning and recombining.

Video clip: [Demonstration of expanded 3-digit column addition](#)

Addition

Year 4 Add numbers with up to 4 digits

Move from expanded addition to the compact column method, **adding units first**, and „**carrying**“ numbers underneath the calculation. Also include money and measures contexts.

e.g. $3517 + 396 = 3913$

$$\begin{array}{r} 3517 \\ + 396 \\ \hline 3913 \end{array}$$

Add units first.

„Carry“ numbers underneath the bottom line.

Introduce the compact column addition method by asking children to add the two given numbers together using the method that they are familiar with (expanded column addition—see Y3). Teacher models the compact method with carrying, asking children to discuss similarities and differences and establish how it is carried out.

Reinforce correct place value by reminding them the actual value is 5 hundreds add 3 hundreds, not 5 add 3, for example.

Use and apply this method to money and measurement values.

Key vocabulary: add, more, plus, and, make, altogether, total, equal to, equals, double, most, count on, number line, sum, tens, units, partition, plus, addition, column, tens boundary, hundreds boundary, increase, vertical, „carry“, expanded, compact, thousands, hundreds, digits, inverse

Key skills for addition at Y4:

- Select most appropriate method: mental, jottings or written and explain why.
- Recognise the place value of each digit in a four-digit number.
- Round any number to the nearest 10, 100 or 1000.
- Estimate and use inverse operations to check answers.
- Solve 2-step problems in context, deciding which operations and methods to use and why.
- Find 1000 more or less than a given number.
- Continue to practise a wide range of mental addition strategies, ie. number bonds, add the nearest multiple of 10, 100, 1000 and adjust, use near doubles, partitioning and recombining.
- Add numbers with up to 4 digits using the formal written method of column addition
- Solve 2-step problems in contexts, deciding which operations and methods to use and why.
- Estimate and use inverse operations to check answers to a calculation.

Addition

Year 5 Add numbers with more than 4 digits

including money, measures and decimals with different numbers of decimal places.

$$\begin{array}{r} \text{£} 23.59 \\ + \text{£} 7.55 \\ \hline \text{£} 31.14 \end{array}$$

The decimal point should be aligned in the same way as the other place value columns, and must be in the same column in the answer.

$$\begin{array}{r} 23481 \\ + 1362 \\ \hline 24843 \end{array}$$

Numbers should exceed 4 digits.

$$\begin{array}{r} 19.01 \\ 3.65 \\ + 0.70 \\ \hline 23.36 \end{array}$$

Pupils should be able to add more than two values, carefully aligning place value columns.

Say „6 tenths add 7 tenths“ to reinforce place value.

Empty decimal places can be filled with zero to show the place value in each column.

Children should:

Understand the place value of tenths and hundredths and use this to align numbers with different numbers of decimal places.

Key vocabulary: add, more, plus, and, make, altogether, total, equal to, equals, double, most, count on, number line, sum, tens, units, partition, plus, addition, column, tens boundary, hundreds boundary, increase, „carry“, expanded, compact, vertical, thousands, hundreds, digits, inverse & decimal places, decimal point, tenths, hundredths, thousandths

Key skills for addition at Y5:

Add numbers mentally with increasing large numbers, using and practising a range of mental strategies ie. add the nearest multiple of 10, 100, 100 and adjust; use near doubles, inverse, partitioning and re-combining; using number bonds.

Use rounding to check answers and accuracy.

Solve multi-step problems in contexts, deciding which operations and methods to use and why.

Read, write, order and compare numbers to at least 1 million and determine the value of each digit.

Round any number up to 1 000 000 to the nearest 10, 100, 1000, 10 000 and 100 000.

Add numbers with more than 4 digits using formal written method of columnar addition.

Video Clip: [Adding decimals](#)

Addition

Year 6 Add several numbers of increasing complexity

$$\begin{array}{r} 23.361 \\ 9.080 \\ 59.770 \\ + 1.300 \\ \hline 93.511 \\ \small 2 \quad 1 \quad 2 \end{array}$$

Adding several numbers with different numbers of decimal places (including money and measures):

Tenths, hundredths and thousandths should be correctly aligned, with the decimal point lined up vertically including in the answer row.

Zeros could be added into any empty decimal places, to show there is no value to add.

Empty decimal places can be filled with zero to show the place value in each column.

$$\begin{array}{r} 81059 \\ 3668 \\ 15301 \\ + 20551 \\ \hline 120579 \\ \small 1 \quad 1 \quad 1 \quad 1 \end{array}$$

Adding several numbers with more than 4 digits.

Key vocabulary: add, more, plus, and, make, altogether, total, equal to, equals, double, most, count on, number line, sum, tens, units, partition, plus, addition, column, tens boundary, hundreds boundary, increase, „carry“, expanded, compact, vertical, thousands, hundreds, digits, inverse, decimal places, decimal point, tenths, hundredths, thousandths

Key skills for addition at Y6:

Perform mental calculations, including with mixed operations and large numbers, using and practising a range of mental strategies.

Solve multi-step problems in context, deciding which operations and methods to use and why.

Use estimation to check answers to calculations and determine, in the context of a problem, levels of accuracy.

Read, write, order and compare numbers up to 10 million and determine the value of each digit.

Round any whole number to a required degree of accuracy.

Pupils understand how to add mentally with larger numbers and calculations of increasing complexity.

Subtraction

Year 1 Subtract from numbers up to 20

Children consolidate understanding of subtraction practically, showing subtraction on bead strings, using cubes etc. and in familiar contexts, and are introduced to more formal recording using number lines as below:

Subtract by taking away

Count back in ones on a numbered number line to take away, with numbers up to 20:

Read, write and interpret number sentences with - and = signs.

Model subtraction using hundred squares and numbered number lines/tracks and practically.

Find the „distance between“

This will be introduced practically with the language „find the distance between“ and „how many more?“ in a range of familiar contexts.

„Seven is 3 more than four“

„I am 2 years older than my sister“

Mental subtraction

Children should start recalling subtraction facts up to and within 10 and 20, and should be able to subtract zero.

Key vocabulary: equal to, take, take away, less, minus, subtract, leaves, distance between, how many more, how many fewer / less than, most, least, count back, how many left, how much less is_?

Key skills for subtraction at Y1:

- Given a number, say one more or one less.
- Count to and over 100, forward and back, from any number.
- Represent and use subtraction facts to 20 and within 20.
- Subtract with one-digit and two-digit numbers to 20, including zero.
- Solve one-step problems that involve addition and subtraction, using concrete objects (ie bead string, objects, cubes) and pictures, and missing number problems.
- Read and write numbers from 0 to 20 in numerals and words.

Subtraction

Year 2 Subtract with 2-digit numbers

Subtract on a number line by counting back, aiming to develop mental subtraction skills.

Use Dienes blocks for subtraction calculations too.

This strategy will be used for:

- 2-digit numbers subtract units (by taking away / counting back) e.g. $36 - 7$
- 2-digit numbers subtract tens (by taking away / counting back) e.g. $48 - 30$
- Subtracting pairs of 2-digit numbers (see below)

Subtracting pairs of 2-digit numbers on a number line:

$47 - 23 = 24$ Partition the second number and subtract it in tens and units, as below:

Then subtract units.

Subtract tens first.

Move towards more efficient jumps back, as below:

Combine methods with use of a hundred square to reinforce understanding of number value and order.

Teaching children to bridge through ten can help them to become more efficient, for example $42 - 25$:

Mental strategy - subtract numbers close together by counting on:

Start with the smaller number and count on to the largest.

Many mental strategies are taught. Children are taught to recognise that when numbers are close together, it is more efficient to count on the difference. They need to be clear about the relationship between addition and subtraction.

Key vocabulary: equal to, take, take away, less, minus, subtract, leaves, distance between, how many more, how many fewer / less than, most, least, count back, how many left, how much less is_? **Key skills for subtraction at Y2:**

- Recognise the place value of each digit in a two-digit number.
- Recall and use subtraction facts to 20 fluently, and derive and use related facts up to 100.
- Subtract using concrete objects, pictorial representations, 100 squares and mentally, including: a two-digit number and ones, a two-digit number and tens, and two two-digit numbers.
- Show that subtraction of one number from another cannot be done in any order.
- Recognise and use inverse relationship between addition and subtraction, using this to check calculations and missing number problems.
- Solve simple addition and subtraction problems including measures, using concrete objects, pictorial representation, and also applying their increasing knowledge of mental and written methods.
- Read and write numbers to at least 100 in numerals and in words.

Subtraction

Year 3 Subtracting with 2 and 3-digit numbers.

Introduce **partitioned column subtraction** method.

STEP 1: introduce this method with examples where no exchanging is required.

$$\begin{array}{r} 89 - 35 = 54 \\ 80 + 9 \\ - 30 + 5 \\ \hline 50 + 4 \end{array}$$

When learning to „exchange“, explore „partitioning in different ways“ so that pupils understand that when you exchange, the **VALUE** is the same ie $72 = 70+2 = 60+12 = 50+22$ etc. Emphasise that the **value hasn't changed**, we have just partitioned it in a different way.

STEP 2: introduce „exchanging“ through practical subtraction. Make the larger number with Base 10, then subtract 47 from it.

STEP 2: introduce „exchanging“ through practical subtraction. Make the larger number with Base 10, then subtract 47 from it.

$$\begin{array}{r} 72 - 47 \\ \hline 60 \\ 70 + 2 \\ - 40 + 7 \\ \hline 20 + 5 = 25 \end{array}$$

Before subtracting 7 from the 72 blocks, they will need to exchange a row of 10 for ten units. Then subtract 7, and subtract 4 tens.

STEP 3: Once pupils are secure with the understanding of „exchanging“, they can use the partitioned column method to subtract any 2 and 3-digit numbers.

$$\begin{array}{r} 238 - 146 = 92 \\ \hline 200 + 30 + 8 \\ - 100 + 40 + 6 \\ \hline 100 + 90 + 2 \end{array}$$

Subtracting money: partition into e.g. £1 + 30p + 8p

Counting on as a mental strategy for subtraction:

Continue to reinforce counting on as a strategy for **close-together numbers** (e.g. 121–118), and also for numbers that are „nearly“ multiples of 10, 100, 1000 or £s, which make it easier to count on (e.g. 102-89, 131–79, or calculating change from £1 etc.).

Start at the smaller number and count on in **tens first**, then count on in units to find the rest of the difference:

Because counting on in tens is the way we use a 100 square.

Key vocabulary: equal to, take, take away, less, minus, subtract, leaves, distance between, how many more, how many fewer / less than, most, least, count back , how many left, how much less is?, difference, count on, strategy, partition, tens, units exchange, decrease, hundreds, value, digit

Key skills for subtraction at Y3:

- Subtract mentally a: 3-digit number and ones, 3-digit number and tens, 3-digit number and hundreds.
- Estimate answers and use inverse operations to check.
- Solve problems, including missing number problems.
- Find 10 or 100 more or less than a given number
- Recognise the place value of each digit in a 3-digit number .
- Counting up differences as a mental strategy when numbers are close together or near multiples of 10
- Read and write numbers up to 1000 in numerals and words.
- Practise mental subtraction strategies, such as subtracting near multiples of 10 and adjusting (e.g. subtracting 19 or 21), and select most appropriate methods to subtract, explaining why.

Video clips: 1- [Subtraction—teaching children to consider the most appropriate methods before calculating](#)

2- [Introducing partitioned column subtraction method, from practical to written](#)

Approximate,
Calculate,

Check it mate!

Subtraction

Year 4 Subtract with up to 4-digit numbers

Partitioned column subtraction with „exchanging“ (decomposition):

$$\begin{array}{r} 2754 - 1562 = 1192 \\ \hline 2000 + 700 + 50 + 4 \\ - 1000 + 500 + 60 + 2 \\ \hline 1000 + 100 + 90 + 2 \end{array}$$

As introduced in Y3, but moving towards more complex numbers and values. Use place value counters to reinforce „exchanging“.

Compact column subtraction (see video)

$$\begin{array}{r} 2754 \\ - 1562 \\ \hline 1192 \end{array}$$

To introduce the compact method, ask children to perform a subtraction calculation with the familiar partitioned column subtraction then display the compact version for the calculation they have done. Ask pupils to consider how it relates to the method they know, what is similar and what is different, to develop an understanding of it (shown on video).

Give plenty of opportunities to apply this to money and measures.

Always encourage children to consider the best method for the numbers involved—mental, counting on, counting back or written method (see videos).

Mental strategies

A variety of mental strategies must be taught and practised, including counting on to find the difference where numbers are closer together, or where it is easier to count on (see video below).

Approximate,
Calculate,
Check it mate!

Key vocabulary: equal to, take, take away, less, minus, subtract, leaves, distance between how many more, how many fewer / less than, most, least, count back , how many left, how much less is?, difference, count on, strategy, partition, tens, units exchange, decrease, hundreds, value, digit, inverse

Key skills for subtraction at Y4:

- Subtract by counting on where numbers are close together or they are near to multiples of 10, 100 etc. Children select the most appropriate and efficient methods for given subtraction calculations.
- Estimate and use inverse operations to check answers.
- Solve addition and subtraction 2-step problems, choosing which operations and methods to use and why.
- Solve simple measure and money problems involving fractions and decimals to two decimal places.
- Find 1000 more or less than a given number.
- Count backwards through zero, including negative numbers.
- Recognise place value of each digit in a 4-digit number Round any number to the nearest 10, 100 or 1000
- Solve number and practical problems that involve the above, with increasingly large positive numbers.

Videos: 1- [Subtraction—teaching children to consider the most appropriate methods before calculating](#)

2- [Introducing partitioned column subtraction method, from practical to written](#)

3- [Moving to the compact column method of subtraction](#)

Subtraction

Year 5 Subtract with at least 4-digit numbers

including money, measures, decimals.

Compact column subtraction

(with „exchanging“).

$$\begin{array}{r} \cancel{3}^{\text{th}} \cancel{1}^{\text{th}} \cancel{0}^{\text{th}} \cancel{8}^{\text{th}} 6 \\ - \quad 2128 \\ \hline 28,928 \end{array}$$

Subtracting with larger integers.

Children who are still not secure with number facts and place value will need to remain on the partitioned column method until ready for the compact method.

See „moving to the compact method“ video.

$$\begin{array}{r} \cancel{7}^{\text{th}} \cancel{1}^{\text{th}} 6 \cancel{9}^{\text{th}} \cdot 0 \\ - \quad 372 \cdot 5 \\ \hline 6796 \cdot 5 \end{array}$$

Subtract with decimal values, including mixtures of integers and decimals, aligning the decimal point.

Add a „zero“ in any empty decimal places to aid understanding of what to subtract in that column.

Create lots of opportunities for subtracting and finding differences with money and measures.

Approximate,
Calculate,
Check it mate!

Key vocabulary: equal to, take, take away, less, minus, subtract, leaves, distance

between, how many more, how many fewer / less than, most, least, count back , how many left, how much less is? difference, count on, strategy, partition, tens, units exchange, decrease, hundreds, value, digit, inverse, tenths, hundredths, decimal point, decimal
Key skills for subtraction at Y5:

Subtract numbers mentally with increasingly large numbers .

Use rounding and estimation to check answers to calculations and determine, in a range of contexts, levels of accuracy .

Solve addition and subtraction multi-step problems in context, deciding which operations and methods to use and why.

Read, write, order and compare numbers to at least 1 million and determine the value of each digit.

Count forwards or backwards in steps of powers of 10 for any given number up to 1 million.

Interpret negative numbers in context, counting forwards and backwards with positive and negative integers through 0.

Round any number up to 1 million to the nearest 10, 100, 1000, 10 000 and 100 000.

Video clip:

[Moving to the compact column method of subtraction](#)

Subtraction

Year 6 Subtracting with increasingly large and more complex

numbers and decimal values.

$$\begin{array}{r} \cancel{3}^{\text{th}} \cancel{8}^{\text{th}} \cancel{0}^{\text{th}} 699 \\ - \quad 89,949 \\ \hline 60,750 \end{array}$$

Using the compact column method to subtract more complex integers

$$\begin{array}{r} \cancel{1}^{\text{th}} \cancel{0}^{\text{th}} 5 \cdot \cancel{4}^{\text{th}} 19 \text{ kg} \\ - \quad 36 \cdot 080 \text{ kg} \\ \hline 69 \cdot 339 \text{ kg} \end{array}$$

Using the compact column method to subtract money and measures, including decimals with different numbers of decimal places.

Empty decimal places can be filled with zero to show the place value in each column.

Pupils should be able to apply their knowledge of a range of mental strategies, mental recall skills, and informal and formal written methods when selecting the most appropriate method to work out subtraction problems.

Approximate,
Calculate,
Check it mate!

Key vocabulary: equal to, take, take away, less, minus, subtract, leaves, distance

between, how many more, how many fewer / less than, most, least, count back , how many left, how much less is? difference, count on, strategy, partition, tens, units exchange, decrease, hundreds, value, digit, inverse, tenths, hundredths, decimal point, decimal
Key skills for subtraction at Y6:

Solve addition and subtraction multi-step problems in context, deciding which operations and methods to use and why.

Read, write, order and compare numbers up to 10 million and determine the value of each digit

Round any whole number to a required degree of accuracy

Use negative numbers in context, and calculate intervals across zero.

Children need to utilise and consider a range of mental subtraction strategies, jottings and written methods before choosing how to calculate.

See previous videos for introducing the compact column method.

Multiplication

Year 1 Multiply with concrete objects, arrays and pictorial representations.

How many legs will 3 teddies have?

There are 3 sweets in one bag.
How many sweets are in 5 bags altogether?

Give children experience of counting equal group of objects in 2s, 5s and 10s.

Present practical problem solving activities involving counting equal sets or groups, as above.

Key vocabulary: groups of, lots of, times, array, altogether, multiply, count

Key skills for multiplication at Y1:

Count in multiples of 2, 5 and 10.

Solve one-step problems involving multiplication, by calculating the answer using concrete objects, pictorial representations and arrays with the support of the teacher.

Make connections between arrays, number patterns, and counting in twos, fives and tens.

Begin to understand doubling using concrete objects and pictorial representations.

Multiplication

Year 2 Multiply using arrays and repeated addition
(using at least 2s, 5s and 10s)

Use repeated addition on a number line:

Starting from zero, make equal jumps up on a number line to work out multiplication facts and write multiplication statements using x and = signs.

Use arrays:

$$5 \times 3 = 15$$

$$5 \times 3 = 3 + 3 + 3 = 15$$

$$3 \times 5 = 5 + 5 + 5 = 15$$

$$3 \times 5 = 15$$

Use arrays to help teach children to understand the commutative law of multiplication, and give examples such as $3 \times \underline{\quad} = 6$.

Use practical apparatus:

Use mental recall:

Children should begin to recall multiplication facts for 2, 5 and 10 times tables through practice in counting and understanding of the operation.

Key vocabulary: groups of, lots of, times, array, altogether, multiply, count, multiplied by, repeated addition, column, row, commutative, sets of, equal groups, times as big as, once, twice, three times...

Key skills for multiplication at Y2:

Count in steps of 2, 3 and 5 from zero, and in 10s from any number.

Recall and use multiplication facts from the 2, 5 and 10 multiplication tables, including recognising odds and evens.

Write and calculate number statements using the x and = signs.

Show that multiplication can be done in any order (commutative).

Solve a range of problems involving multiplication, using concrete objects, arrays, repeated addition, mental methods, and multiplication facts.

Pupils use a variety of language to discuss and describe multiplication.

Video clips:

[Teaching for understanding of multiplication facts](#)
[Practical multiplication and the commutative law](#)

Multiplication

Year 3 Multiply 2-digits by a single digit number

Introduce the **grid method** for multiplying 2-digit by single-digits:

Eg. $23 \times 8 = 184$

X	20	3
8	160	24

$160 + 24 = 184$

Link the layout of the grid to an array initially:

Introduce the grid method with children physically making an array to represent the calculation (e.g. make 8 lots of 23 with 10s and 1s place value counters), then translate this to grid method format (see video clip).

To do this, children must be able to:

Partition numbers into tens and units

Multiply multiples of ten by a single digit (e.g. 20×4) using their knowledge of multiplication facts and place value

Recall and work out multiplication facts in the 2, 3, 4, 5, 8 and 10 times tables.

Work out multiplication facts not known by repeated addition or other taught mental strategies (e.g. by commutative law, working out near multiples and adjusting, using doubling etc.) Strategies to support this are repeated addition using a number line, bead bars and arrays:

$9 \times 4 = 36$

Key vocabulary: groups of, lots of, times, array, altogether, multiply, count, multiplied by, repeated addition, column, row, commutative, sets of, equal groups, times, _times as big as, once, twice, three times... partition, grid method, multiple, product, tens, units, value
Key skills for multiplication at Y3:

Recall and use multiplication facts for the 2, 3, 4, 5, 8 and 10 multiplication tables, and multiply multiples of 10.

Write and calculate number statements using the multiplication tables they know, including 2-digit x single-digit, drawing upon mental methods, and progressing to reliable written methods.

Solve multiplication problems, including missing number problems.

Develop mental strategies using commutativity (e.g. $4 \times 12 \times 5 = 4 \times 5 \times 12 = 20 \times 12 = 240$)

Solve simple problems in contexts, deciding which operations and methods to use.

Develop efficient mental methods to solve a range of problems e.g. using commutativity ($4 \times 12 \times 5 = 4 \times 5 \times 12 = 20 \times 12 = 240$) and for missing number problems $x \times 5 = 20, 3 \times \quad = 18, x \quad = 32$

Video clips: [Teaching the grid method as an interim step](#)

Multiplication

Year 4 Multiply 2 and 3-digits by a single digit,

using

all multiplication tables up to 12×12

Developing the grid method:

Eg. $136 \times 5 = 680$

X	100	30	6
5	500	150	30

500
150
+ 30

680

Encourage column addition to add accurately.

Move onto short multiplication (see Y5) if and when children are confident and accurate multiplying 2 and 3-digit numbers by a single digit this way, and are already confident in "carrying" for written addition.

Children should be able to:

Approximate before they calculate, and make this a regular part of their calculating, going back to the approximation to check the reasonableness of their answer. e.g:

$100000000s \text{ approximately } 350 \times 10 = 3500000000$

Record an approximation to check the final answer against.

Multiply multiples of ten and one hundred by a single-digit, using their multiplication table knowledge.

Recall all times tables up to 12×12

Approximate,
Calculate,
Check it mate!

Key vocabulary: groups of, lots of, times, array, altogether, multiply, count, multiplied by, repeated addition, array, column, row, commutative, groups of, sets of, lots of, equal groups, times, multiply, times as big as, once, twice, three times... partition, grid method, total, multiple, product, sets of, inverse

Key skills for multiplication at Y4:

Count in multiples of 6, 7, 9, 25 and 1000

Recall multiplication facts for all multiplication tables up to 12×12 .

Recognise place value of digits in up to 4-digit numbers

Use place value, known facts and derived facts to multiply mentally, e.g. multiply by 1, 10, 100, by 0, or to multiply 3 numbers.

Use commutativity and other strategies mentally $3 \times 6 = 6 \times 3$, $2 \times 6 \times 5 = 10 \times 6$, $39 \times 7 = 30 \times 7 + 9 \times 7$.

Solve problems with increasingly complex multiplication in a range of contexts.

Count in multiples of 6, 7, 9, 25 and 1000

Recognise the place value of each digit in a four-digit number (thousands, hundreds, tens, and ones)

Multiplication

Year 5 Multiply up to 4-digits by 1 or 2 digits.

Introducing column multiplication

Introduce by comparing a grid method calculation to a short multiplication method, to see how the steps are related, but notice how there are less steps involved in the column method (see video).

Children need to be taught to approximate first, e.g. for 72×38 , they will use rounding: 72×38 is approximately $70 \times 40 = 2800$, and use the approximation to check the reasonableness of their answer against.

Short multiplication for multiplying by a single digit

x	300	20	7
4	1200	80	28

	3	2	7
x	4		
	1	3	0
			8

Pupils could be asked to work out a given calculation using the grid, and then compare it to „your“ column method. What are the similarities and differences? Unpick the steps and show how it reduces the steps.

Introduce long multiplication for multiplying by 2 digits

	10	8
10	100	80
3	30	24

	1	8
x	1	3
	5	4
	2	
	1	8
	2	3
	4	

18×3 on the 1st row

($8 \times 3 = 24$, carrying the 2 for twenty, then 1×3).

18×10 on the 2nd row. Put a zero in units first, then say 8×1 , and 1×1 .

Moving towards more complex numbers:

	1	2	3	4
x			1	6
	7	4	0	4
	1	2	3	0
	1	9	7	4

(1234×6)
(1234×10)

	3	6	5	2
x				8
	2	9	2	1
		5	4	

Approximate,
Calculate,
Check it mate!

The grid could be used to introduce long multiplication as the relationship can be seen in the answers in each row.

Key vocabulary groups of, lots of, times, array, altogether, multiply, count, multiplied by, repeated addition, column, row, commutative, sets of, equal groups, times as big as, once, twice, three times, partition, grid method, total, multiple, product, inverse, square, factor, integer, decimal, short/long multiplication, carry

Key skills for multiplication at Y5:

Identify multiples and factors, using knowledge of **multiplication tables to 12×12** .

Solve problems where larger numbers are decomposed into their factors

Multiply and divide integers and decimals by 10, 100 and 1000

Recognise and use square and cube numbers and their notation

Solve problems involving combinations of operations, choosing and using calculations and methods appropriately.

Video clips:

[Moving from grid method to a compact method](#)

[Reinforcing rapid times table recall:](#)

[Demonstration of long multiplication](#)

Multiplication

Year 6 Short and long multiplication as in Y5, and multiply decimals with up to 2d.p by a single digit.

	3	.	1	9
x	8			
	2	5	.	5
				2

Line up the decimal points in the question and the answer.

Remind children that the single digit belongs in the units column.

This works well for multiplying money (E.p) and other measures.

Children will be able to:

Use rounding and place value to make approximations before calculating and use these to check answers against.

Use **short multiplication** (see Y5) to multiply numbers with more than 4-digits by a single digit; to multiply money and measures, and to multiply decimals with up to 2d.p. by a single digit.

Use **long multiplication** (see Y5) to multiply numbers with at least 4 digits by a 2-digit number.

Approximate,
Calculate,
Check it mate!

Key vocabulary: groups of, lots of, times, array, altogether, multiply, count, multiplied by, repeated addition, array, column, row, commutative, sets of, equal groups, times as big as, once, twice, three times, partition, grid method, total, multiple, product, inverse, square, factor, integer, decimal, short / long multiplication, „carry“, tenths, hundredths, decimal

Key skills for multiplication at Y6:

Recall multiplication facts for all times tables up to 12×12 (as Y4 and Y5).

Multiply multi-digit numbers, up to 4-digit \times 2-digit using long multiplication.

Perform mental calculations with mixed operations and large numbers.

Solve multi-step problems in a range of contexts, choosing appropriate combinations of operations and methods.

Estimate answers using round and approximation and determine levels of accuracy.

Round any integer to a required degree of accuracy.

Video clips:

[Moving from grid method to a compact method](#)

[Reinforcing rapid times table recall:](#)

[Demonstration of long multiplication](#)

Division

Year 1 Group and share small quantities

Using objects, diagrams and pictorial representations to solve problems involving both grouping and sharing.

How many groups of 4 can be made with 12 stars? = 3

Grouping:

Sharing:

12 shared between 3 is 4

Example division problem in a familiar context:

There are 6 pupils on this table and there are 18 pieces of fruit to share between us. If we share them equally, how many will we each get?

Can they work it out and give a division statement... ?

"18 shared between 6 people gives you 3 each."

Pupils should :

Use lots of practical apparatus, arrays and picture representations

Be taught to understand the difference between „grouping“ objects (How many groups of 2 can you make?) and „sharing“ (Share these sweets between 2 people)

Be able to count in multiples of 2s, 5s and 10s.

Find half of a group of objects by sharing into 2 equal groups.

Key Vocabulary: share, share equally, one each, two each..., group, groups of, lots of, array

Key number skills needed for division at Y1:

Solve one-step problems involving multiplication and division, by calculating the answer using concrete objects, pictorial representations arrays with the support of the teacher

Through grouping and sharing small quantities, pupils begin to understand, division, and finding simple fractions of objects, numbers and quantities.

They make connections between arrays, number patterns, and counting in twos, fives and tens.

Video Clip: [Sharing and grouping](#)

Division

Year 2 Group and share, using the ÷ and = sign

Use objects, arrays, diagrams and pictorial representations, and grouping on a number line.

Arrays:

This represents $12 \div 3$, posed as how many groups of 3 are in 12?

Pupils should also show that the same array can represent $12 \div 4 = 3$ if grouped horizontally.

Know and understand sharing and grouping:

6 sweets shared between 2 people, how many do they each get?

Grouping

Grouping using a number line:

Group from zero in equal jumps of the divisor to find target number

Make use of a bead string or practical apparatus to work out

This is an important method to

develop understanding of division as grouping.

$$12 \div 3 = 4$$

Pose $12 \div 3$ How many groups of 3 are in 12?"

Key Vocabulary: share, share equally, one each, two each..., group, equal groups of, lots of, array, divide, divided by, divided into, division, grouping, number line, left, left over
Key number skills needed for division at Y2:

Count in steps of 2, 3, and 5 from 0

Recall and use multiplication and division facts for the 2, 5 and 10 multiplication tables, including recognising odd and even numbers.

Calculate mathematical statements for multiplication and division within the multiplication tables and write them using the \times , \div and $=$ signs.

Show that multiplication of two numbers can be done in any order (commutative) and division of one number by another cannot.

Solve problems involving multiplication and division, using materials, arrays, repeated addition, mental methods, and multiplication and division facts, including problems in contexts.

Division

Year 3 Divide 2-digit numbers by a single digit

(where there is no remainder in the final answer)

Grouping on a number line:

$$13 \div 3 = 4 \text{ r } 1$$

STEP 1: Children continue to work out unknown division facts by grouping on a number line from zero. They are also now taught the concept of **remainders**, as in the example. This should be introduced practically and with arrays, as well as being translated to a number line. Children should work towards calculating some basic division facts with remainders mentally for the 2s, 3s, 4s, 5s, 8s and 10s, ready for „carrying“ remainders across within the short division method.

Short division: Limit numbers to

NO remainders in the answer OR carried (each digit must be a multiple of the divisor).

STEP 2: Once children are secure with division as grouping and demonstrate this using number lines, arrays etc., **short division** for larger 2-digit numbers should be introduced, initially with carefully selected examples requiring no calculating of remainders at all. Start by introducing the layout of short division by comparing it to an array.

Remind children of correct place value, that 96 is equal to 90 and 6, but in short division, pose:

- How many 3's in 9? $9 \div 3 = 3$, and record it above the **9** tens.
- How many 3's in 6? $6 \div 2 = 2$, and record it above the **6** units.

Short division: Limit numbers to

NO remainders in the final answer, but with remainders occurring within the

STEP 3: Once children demonstrate a full understanding of remainders, and also the short division method taught, they can be taught how to use the method when remainders occur within the calculation (e.g. $96 \div 4$), and be taught to „carry“ the remainder onto the next digit. **If needed, children should use the number line to work out individual division facts that occur which they are not yet able to recall mentally.**

Real life contexts need to be used routinely to help pupils gain a full understanding, and the ability to recognise the place of division and how to apply it to problems.

Step 3 Only taught when pupils can calculate „remainders“

Key Vocabulary: share, share equally, one each, two each..., group, equal groups of, lots of, array, divide, divided by, divided into, division, grouping, number line, left, left over, inverse, short division, „carry“, remainder, multiple

Key number skills needed for division at Y3:

Recall and use multiplication and division facts for the 2, 3, 4, 5, 8 and 10 multiplication tables (through doubling, connect the 2, 4 and 8s).

Write and calculate mathematical statements for multiplication and division using the multiplication tables that they know, including for two-digit numbers times one-digit numbers, using mental and progressing to formal written methods.

Solve problems, in contexts, and including missing number problems, involving multiplication and division.

Pupils develop efficient mental methods, for example, using multiplication and division facts (e.g. using $3 \times 2 = 6$, $6 \div 3 = 2$ and $2 \times 6 = 3$) to derive related facts ($30 \times 2 = 60$, so $60 \div 3 = 20$ and $20 \times 6 = 3$).

Pupils develop reliable written methods for division, starting with calculations of 2-digit numbers by 1-digit numbers and progressing to the formal written method of short division.

Division

Year 4 Divide up to 3-digit numbers by a single digit

(without remainders initially)

Continue to develop short division:

Short division should only be taught once children have secured the skill of calculating „remainders“.

STEP 1: Pupils must be secure with the process of short division for dividing 2-digit numbers by a single digit (those that do not result in a final remainder —see steps in Y3), but must understand how to calculate remainders, using this to „carry“ remainders within the calculation process (see example).

Real life contexts need to be used routinely to help pupils gain a full understanding, and the ability to recognise the place of division and how to apply it to problems.

STEP 2: Pupils move onto dividing numbers with up to 3-digits by a single digit, however problems and calculations provided should not result in a final answer with remainder at this stage. Children who exceed this expectation may progress to Y5 level.

When the answer for the first column is zero (1 = 5, as in example), children could initially write a zero above to acknowledge its place, and must always „carry“ the number (1) over to the next digit as a remainder.

Include money and measure contexts when confident.

Key Vocabulary: share, share equally, one each, two each..., group, equal groups of, lots of, array, divide, divided by, divided into, division, grouping, number line, left, left over, inverse, short division, „carry“, remainder, multiple, divisible by, factor

Key number skills needed for division at Y4:

Recall multiplication and division facts for all numbers up to 12×12 .

Use place value, known and derived facts to multiply and divide mentally, including: multiplying and dividing by 10 and 100 and 1.

Pupils practise to become fluent in the formal written method of short division with exact answers when dividing by a one-digit number

Pupils practise mental methods and extend this to three-digit numbers to derive facts, for example $200 \times 3 = 600$ so $600 \div 3 = 200$

Pupils solve two-step problems in contexts, choosing the appropriate operation, working with increasingly harder numbers. This should include correspondence questions such as three cakes shared equally between 10 children.

Video Clip: [Short division](#)

Division

Year 5 Divide up to 4 digits by a single digit, including those with remainders.

Short division, including remainder answers:

$$\begin{array}{r} 0663r5 \\ 8 \overline{)533029} \end{array}$$

The answer to $5309 \div 8$ could be expressed as 663 and five eighths, $663 \frac{5}{8}$, as a decimal, or rounded as appropriate to the problem involved.

Include money and measure contexts.

See Y6 for how to continue the short division to give a decimal answer for children who are confident.

Approximate,
Calculate,
Check it mate!

If children are confident and accurate:

- Introduce **long division** for pupils who are ready to divide any number by a 2-digit number (e.g. $2678 \div 19$). This is a Year 6 expectation—see

Short division with remainders: Now that pupils are introduced to examples that give rise to remainder answers, division needs to have a real life problem solving context, where pupils consider the meaning of the remainder and how to express it, i.e. as a fraction, a decimal, or as a rounded number or value, depending upon the context of the problem.

Key Vocabulary: share, share equally, one each, two each..., group, equal groups of, lots of, array, divide, divided by, divided into, division, grouping, number line, left, left over, inverse, short division, carry, remainder, multiple, divisible by, factor, inverse, quotient, prime number, prime factors, composite number (non-prime)

Key number skills needed for division at Y5:

Recall multiplication and division facts for all numbers up to 12×12 (as in Y4).

Multiply and divide numbers mentally, drawing upon known facts.

Identify multiples and factors, including finding all factor pairs of a number, and common factors of two number.

Solve problems involving multiplication and division where larger numbers are decomposed into their factors.

Multiply and divide whole numbers and those involving decimals by 10, 100 and 1000.

Use the vocabulary of prime numbers, prime factors and composite (non-prime) numbers.

Work out whether a number up to 100 is prime, and recall prime numbers to 19.

Divide numbers up to 4 digits by a one-digit number using the formal written method of short division and interpret remainders appropriately for the context

Use multiplication and division as inverses.

Interpret non-integer answers to division by expressing results in different ways according to the context, including with remainders, as fractions, as decimals or by rounding (e.g. $98 \div 4 = 24 \text{ r } 2 = 24 \frac{2}{4} = 24.5 \approx 25$).

Solve problems involving combinations of all four operations, including understanding of the equals sign, and including division for scaling by different fractions and problems involving simple rates.

Video Clip: [Short division with remainders](#)

Division

Year 6 Divide at least 4 digits by both single-digit and 2-digit numbers (including decimal numbers and quantities)

Short division, for dividing by a single digit: e.g. $6497 \div 8$

$$\begin{array}{r} 0812.125 \\ 8 \overline{)6497.000} \end{array}$$

Short division with remainders: Pupils should continue to use this method, but with numbers to at least 4 digits, and understand how to express remainders as fractions, decimals, whole number remainders, or rounded numbers. Real life problem solving contexts need to be the starting point, where pupils have to consider the most appropriate way to express the remainder.

Calculating a decimal remainder: In this example, rather than expressing the remainder as $r 1$, a decimal point is added after the units because there is still a remainder, and the one remainder is carried onto zeros after the decimal point (to show there was no decimal value in the original number). Keep dividing to an appropriate degree of accuracy for the problem being solved.

Introduce **long division by chunking** for dividing by 2 digits.

$$\begin{array}{r} 27 \\ 36 \overline{)972} \\ - 720 \\ \hline 252 \\ - 252 \\ \hline 0 \end{array}$$

Answer: 27

- Find out „How many 36s are in 972?” by subtracting „chunks” of 36, until zero is reached (or until there is a remainder).

Teach pupils to write a „useful list” first at the side that will help them decide what chunks to use, e.g.:

$$\begin{array}{l} \square \text{Useful List: } 1 \times 36 \\ 10 \times = 360 \\ 100 \times = 3600 \end{array}$$

- Introduce the method in a simple way by limiting the choice of chunks to „Can we use 10 lots? Can we use 100 lots? As children become confident with the process, encourage more efficient chunks to get to the answer more quickly (e.g. $20 \times$, $5 \times$), and expand on their „useful” lists.

Where remainders occur, pupils should express them as fractions, decimals or use rounding, depending upon the problem.

Approximate,
Calculate,
Check it mate!

Key Vocabulary: As previously, & common factor

Key number skills needed for division at Y6:

Recall and use multiplication and division facts for all numbers to 12×12 for more complex calculations
Divide numbers up to 4 digits by a two-digit whole number using the formal written method of long division, and interpret remainders as whole number remainders, fractions, or by rounding, as appropriate for the context. Use short division where appropriate.

Perform mental calculations, including with mixed operations and large numbers.

Identify common factors, common multiples and prime numbers.

Solve problems involving all 4 operations.

Use estimation to check answers to calculations and determine accuracy, in the context of a problem.

Use written division methods in cases where the answer has up to two decimal places.

Solve problems which require answers to be rounded to specified degrees of accuracy.

Video Clip: [Long Division](#)

Year 1 Recognise $\frac{1}{2}$ and $\frac{1}{4}$

Use objects, shapes or quantities to find $\frac{1}{2}$ and $\frac{1}{4}$. Encourage children to use equal grouping or sharing.

Begin by folding shapes into halves and quarters. Then begin grouping.

This is how many of the groups we need to count

1/2

This is how many groups we need to make altogether

Split 6 sweets into 2 groups-we want to count how many is in 1 group.

$\frac{1}{2}$ of 6 sweets =

Use discrete wholes e.g. sweets, marbles, beads.

Use continuous wholes e.g. pizza, cake, chocolate bars.

Key vocabulary: half, equal, parts, quarter, fractions, 1 of 2, 1 of 4, sharing, grouping, whole

Key skills for fractions at Y1:

Recognise, find and name a half as 1 of 2 equal parts of an object, shape or quantity. Recognise, find and name a quarter as 1 of 4 equal parts of an object, shape of quantity. Connect halves and quarters to the equal sharing and grouping of a set of objects and to measures, as well as combining halves and quarters to make a whole.

Year 2 Write simple fractions

Children should write simple fractions and connect unit fractions (when the top number is 1) to equal sharing and grouping as in Year 1.

Following the same method of looking at how many groups are needed altogether and how many we need to count.

Children will meet $\frac{3}{4}$ as the first example of a non-unit fraction (when the top number is higher than one).

e.g. $\frac{3}{4}$ of 12 =

We want to count how many is in 3 of the 4 groups

Use objects and shapes to look at the equivalence of $\frac{3}{4}$ and $\frac{2}{4}$

Key vocabulary: equivalence, $\frac{1}{3}$ $\frac{1}{4}$ $\frac{2}{4}$ $\frac{3}{4}$, equal, sharing, grouping, fraction, numbers,

Key skills for fractions at Y2:

Recognise, find, name and write fractions $\frac{1}{3}$ $\frac{1}{4}$ $\frac{2}{4}$ and $\frac{3}{4}$ of a length, shape, set of objects or quantities.

Write simple fractions, for example $\frac{1}{2}$ of 6 = 3 and recognise the equivalence of $\frac{2}{4}$ and $\frac{1}{2}$.

Count in fractions up to 10 using $\frac{1}{2}$ and $\frac{1}{4}$, using equivalence e.g. 1 $\frac{2}{4}$, 1 $\frac{1}{2}$

Video Clip: [Video Clip: Y2/3 Fractions](#)

Year 3 Count in tenths. Add fractions.

$\frac{1}{2}$

Children should begin adding fractions but only with the **same** denominator. Use diagrams and pictures to help with this. The same methods can be applied when subtracting fractions.

$$\frac{2}{6} + \frac{1}{6} = \frac{3}{6}$$

Children can then move on from using visual aids once they understand the concept. They should have the opportunity and access to use visual aids as long as it is necessary.

Key vocabulary: tenths, ten equal parts, dividing, fractions, denominators, equivalent fractions, compare, order.

Key skills for fractions at Y3:

Count up and down in tenths; recognise that tenths arise from dividing an object into 10 equal parts and in dividing one-digit numbers or quantities by 10.

Recognise, find and write fractions of a discrete set of objects: unit fractions and non-unit fractions with small denominators.

Recognise and show, using diagrams, equivalent fractions with small denominators.

Add and subtract fractions with the same denominator within one whole (e.g. $\frac{1}{7} + \frac{5}{7} = \frac{6}{7}$).

Compare and order unit fractions, and fractions with the same denominators.

Solve problems that involve all of the above.

Video Clip: Video Clip: [Y2/3 Fractions](#)

Year 4 Recognise families of common equivalent fractions.

$\frac{1}{2}$

Equivalent fractions are obtained by **multiplying** or **dividing** both the numerator and denominator by the **same** number.

To simplify a fraction, both the numerator and denominator must be **divided** by the **same** number. This is also called **cancelling down** or **reducing the fraction**.

Example:

Complete the following equivalent fractions:

$$\frac{2}{5} = \frac{\square}{10}$$

Whatever you do to the top, you must do to the bottom!!

SOLUTION:

$$\frac{2}{5} = \frac{2 \times 2}{2 \times 5} = \frac{4}{10}$$

(Both numerator and denominator are multiplied by 2)

Example:

$$\text{Simplify } \frac{32}{48}$$

SOLUTION:

$$\frac{32}{48} = \frac{32 \div 8}{48 \div 8} = \frac{4}{6}$$

(Both sides are divided by 8, so the fraction is cancelled by 8)

But the result is **not** in the **Simplest form**. It still can be simplified:

$$\frac{4}{6} = \frac{4 \div 2}{6 \div 2} = \frac{2}{3}$$

(Both sides are divided by 2, so the fraction is reduced by 2)

When children are solving simple fractions, they can also start to use their multiplication tables and the inverse, division, to help solve finding fractions of larger amounts.

e.g. $\frac{1}{4}$ of 24. The denominator is 4, so we are going to see how many 4's fit into 24 = 6.

e.g. $\frac{1}{7}$ of 35. The denominator is 7, so we are going to see how many 7's fit into 35 = 5.

e.g. $\frac{4}{6}$ of 18. The denominator is 6, so we are going to see how many 6's fit into 18 = 3. **BUT** because the numerator is 4, we now need to multiply 3 by the numerator, 4, $3 \times 4 = 12$.

Key vocabulary: common equivalent fractions, simplify, hundredths, tenths, dividing, add, subtract, denominator, numerator, decimal, value, digits, ones, round, whole number, compare, decimal places,

Key skills for fractions at Y4:

Recognise and show, using diagrams, families of common equivalent fractions.

Count up and down in hundredths; recognise that hundredths arise when dividing an object by 100 and dividing tenths by 10.

Solve problems involving increasingly harder fractions to calculate quantities, and fractions, to divide quantities, including non-unit fractions where the answer is a whole number.

Add and subtract fractions with the same denominator.

Recognise and write decimal equivalents of any number of tenths or hundreds.

Recognise and write decimal equivalents to $\frac{1}{2}$, $\frac{1}{5}$, $\frac{2}{5}$.

Find the effect of dividing a one or two digit number by 10 and 100, identifying the value of the digits in the answer as one, tenths and hundredths,

Round decimals with 1 decimal place to the nearest whole number.

Compare numbers with the same number of decimal places up to 2 decimal places.

Solve simple measure and money problems involving fractions and decimals to 2 decimal places.

Year 5 Recognise mixed number and improper fractions and convert from one to the other. Convert between decimals, percentages and fractions.

Children should recognise mixed number and improper fractions

Mixed numbers can also be expressed as a fraction: each whole pizza contains four quarters. Four quarters of pizza plus three quarters of pizza is seven quarters of pizza.

To turn a mixed number into a fraction, multiply the whole number by the denominator (the bottom part), and add the result to the numerator (the top part). $1 \frac{3}{4} \Rightarrow$ The whole number is 1. So $1 \times 4 = 4$. Add the result to the numerator. The numerator is $3 + 4 = 7$. The numerator is 7, the denominator remains 4.

To write an improper fraction as a mixed number, divide the numerator (top part) by the denominator (bottom part). The quotient is the whole number and the remainder is the numerator.

E.g. How would you express $13/4$ as a mixed number? Divide the numerator by the denominator. $13 \div 4 = 3$ with a remainder of 1. The quotient, 4, is the whole number. The remainder, 1, is the numerator. The denominator remains 4. $13/4 = 3 \frac{1}{4}$

CHILDREN MUST KNOW THE FOLLOWING FACTS

$\frac{1}{2}$	$\frac{1}{4}$	1/5	2/5	4/5
0.5	0.25	0.2	0.4	0.8
50%	25%	20%	40%	80%

Key vocabulary: compare, order, denominators, multiples, equivalent, tenths, hundredths, mixed number, improper fractions, add, subtract, multiply, proper fractions, decimal numbers, thousandths, round, order.

Key skills for fractions at Y5:

Compare and order fractions whose denominators are all multiples of the same number.

Identify, name and write equivalent fractions of a given fraction, represented visually, including tenths and hundredths.

Recognise mixed numbers and improper fractions and convert from one form to the other and write mathematical statements >1 as a mixed number (e.g. $2/5 + 4/5 = 6/5 = 1 \frac{1}{5}$)

Add and subtract fractions with the same denominator, and denominators that are multiples of the same number,

Multiply proper fractions and mixed numbers by whole numbers, supported by materials and diagrams.

Read and write decimal numbers as fractions (e.g. $0.71 = 71/100$)

Recognise and use thousandths and relate them to tenths, hundredths and decimal equivalents.

Round decimals with 2 decimal places to the nearest whole number and to 1 decimal place.

Read, write, order and compare number up to 3 decimal places.

Solve problems involving number up to 3 decimal places.

Recognise the % symbol and understand that per cent relates to 'number of parts per 100', and write percentages as a fraction with denominator 100, and as a decimal fraction.

Solve problems which require knowing percentage and decimal equivalents of $\frac{1}{2}$ $\frac{1}{5}$ $2/5$ $4/5$ and those fractions with a denominator of a multiple of 10 or 25.

Year 6 Multiply simple pairs of proper fractions, with the answer in the simplest form. Divide proper fractions by whole numbers.

There are 3 simple steps to multiplying fractions.

- 1) Multiply the top numbers
- 2) Multiply the bottom numbers (the denominators)
- 3) Simplify the fraction if needed

$$\frac{1}{2} \times \frac{2}{5}$$

Step 1: Multiply the top numbers

$$\frac{1 \times 2}{2 \times 5} = \frac{2}{10}$$

Step 2: Multiply the bottom numbers

$$\frac{1 \times 2}{2 \times 5} = \frac{2}{10}$$

Step 3: Simplify the fraction (see year 4)

$$\frac{2}{10} = \frac{1}{5}$$

There are 2 simple steps to dividing fractions.

- 1) Multiply the bottom number of the fraction by the whole number
- 2) Simplify the fraction (if needed)

$$\frac{1}{2} \div 3$$

Step 1: Multiply the bottom number of the fraction by the whole number.

$$\frac{1}{2 \times 3} = \frac{1}{6}$$

Step 2: Fraction is already as simple as possible, so no need for step 2. Answer:

$$\frac{1}{2} \div 3 = \frac{1}{6}$$

Key vocabulary: common factors, simplify fractions, common multiples, denomination, compare, order, add, subtract, different denominator, mixed number, proper fractions, simplest form, division, decimal fraction equivalents, simple fractions, percentages, round, multiply, whole numbers.

Key skills for fractions at Y6:

Use common factors to simplify fractions; use common multiples to express fractions in the same denomination.

Compare and order fractions, including fractions >1 .

Add and subtract fractions with different denominators and missed numbers, using the concept of equivalent fractions.

Multiply simple pairs of proper fractions, writing the answer in its simplest form (e.g. $1/3 \div 2 = 1/6$)

Associate a fraction with division and calculate decimal fraction equivalents (e.g. 0.375) for a simple fraction (e.g. $3/8$).

Identify the value of each digit in numbers given to 3 decimal places and multiply and divide numbers by 10, 100 and 1000 giving answers p to 3 decimal places.

Multiply one digit numbers with up to 2 decimal places by whole numbers.

Use written division methods in cases where the answer has up to 2 decimal places.

Solve problems which require answers to be rounded to specific degrees of accuracy.

Recall and use equivalence between simple fractions, decimals and percentages, including in different contexts.
